2016 ANNUAL SUMMARY REPORT

Pearce Creek Confined Disposal Facility

March 2017

1.0 INTRODUCTION

This Annual Summary Report was developed at the request of the Maryland Department of the Environment (MDE) in accordance with the MDE's approval of the Groundwater Monitoring Plan (GWMP), as part of renewing placement of dredge material by the U.S. Army Corps of Engineers, Philadelphia District (USACE) at the Pearce Creek Confined Disposal Facility (CDF). The MDE approved the GWMP on February 16, 2017.

The Pearce Creek CDF is located in Earleville, Cecil County, Maryland, immediately south of Pearce Creek and the eastern shore of the Elk River, a major tributary of the Chesapeake Bay. The CDF is bounded by residential properties to the west, by residential, agricultural, and undeveloped properties to the south and east, and by Pearce Creek and the Elk River to the north.

The purpose of the Annual Summary Reports is to present groundwater sampling and water level data to monitor potential changes in groundwater quality resulting from the installation of an impermeable liner designed to mitigate the effects of future and past dredge disposal at the Pearce Creek CDF. This specific report summarizes historical groundwater sampling performed at the site from 1996 (when wells were first installed) to 2016. Future Annual Summary Reports will include well construction information for any new wells installed, groundwater elevation contour maps for each aquifer, and sampling data from the new network of 37 wells that will be sampled twice per year.

2.0 HISTORICAL SAMPLING EVENTS AND METHODOLOGY

This report includes a summary of previous sampling results from historical data collected before the U.S. Geological Survey (USGS) investigation, the USGS data, and analytical results from subsets of wells sampled by the USACE in 2012, 2014, and 2016.

The dates of the specific individual sampling events were:

- February/March 1996 – Monitoring well sampling by USACE
- October 1996 – Monitoring well sampling by USACE
- April 2010 - February 2011 – Monitoring well sampling by USGS
- June 2010 – Private domestic well sampling by USGS
- June/July 2012 – Monitoring well sampling by USACE
- April 2014 – Monitoring well sampling by USACE
- March 2016 – Monitoring well sampling by USACE
- September 2016 – Monitoring well sampling by USACE.

Groundwater samples during each event were collected for chemical analysis using standard USEPA and/or USGS low-flow sampling procedures. In general, the groundwater samples were analyzed for the following parameters:

- Total Metals: Aluminum, Arsenic, Beryllium, Cadmium, Calcium, Iron, Lead,

- Magnesium, Manganese, Nickel, Potassium, Sodium, and Zinc
- General Chemistry Parameters: Alkalinity, Total Dissolved Solids, Total Suspended Solids, Fluoride, Chloride, Bromide, Sulfate, Nitrogen (nitrite and nitrate), Nitrogen (nitrate), and Nitrogen (nitrite)
- Radiologic Parameters: Radium 226, Radium 228, Gross Alpha, and Gross Beta

Screen interval depths and aquifer information for monitoring wells and private wells are included in Table 1. This table contains a list of the existing monitoring wells, monitoring wells that were abandoned during liner construction, and private potable wells sampled in the past. Figure 1 shows the location of historical monitoring well sampling locations, including those that have been, or will be abandoned. Note that the 4 Upper Patapsco Deep wells installed on private properties in West View Shores and Bay View Estates (CSW-23 through 26) and sampled in 2014 and 2016 will be abandoned when the public water supply is available, so they are not part of the long-term GWMP. Figure 2 shows the locations of the private domestic wells sampled by the USGS.

3.0 LABORATORY ANALYSIS AND GROUNDWATER SAMPLING RESULTS

Groundwater samples were analyzed using standard USEPA and/or USGS methods. It should be noted that in the past, laboratory analysis for all the parameters listed above in Section 2.0 may not have been performed during some events (particularly the radiological parameters).

However, per the approved GWMP, future sampling events will require analysis for all these parameters.

Tables 2 through 9 summarize the sampling results. The sampling results are compared with the Federal USEPA Maximum Contaminant Levels (MCLs) for drinking water quality and Secondary Drinking Water Regulations (non-mandatory standards based on aesthetics – taste, color, odor), as well as Groundwater Quality Standards established by the MDE.

4.0 FUTURE ACTIVITIES

- Drilling and installation of 18 new monitoring wells will be completed in the early summer 2017.
- These new wells and 19 others will then be sampled as part of the GWMP (a total of 37 monitor wells and piezometers). Two groundwater sampling events (summer and fall) spaced 3 to 4 months apart will be conducted in 2017 (in future years these sampling events will be in the spring and fall).
- A regular program will be initiated for monitoring water levels at the CDF.
- Placement of dredge material into the CDF is expected to begin sometime in the fall 2017, after the second groundwater sampling event.

- The USACE will develop a database for the project which will allow better evaluation of groundwater chemistry changes over time.
- The second annual report will be submitted in February 2018. This report will include sampling results from the new network of 37 wells around the CDF. Groundwater quality trend plots (if applicable), groundwater elevation contour maps, and other pertinent information also will be included in subsequent annual reports.

TABLES

Table Notes for Groundwater Sampling Results
Pearce Creek Confined Disposal Facility
Cecil County, Maryland

Table Notes

mg/l: milligrams per liter

pCi/l: picoCuries per liter

mR/year: milliREM per year (The standard laboratory reporting units for gross beta radiation (pCi/l) cannot be directly correlated to the National Drinking Water Standard, which is presented as an annual dose equivalent. The results for gross beta radiation were compared with the 50 pCi/l screening level provided in the National Drinking Water Regulations, Code of Federal Regulations.)

Q: Qualifiers

U: The analyte was analyzed for but was not detected above the reported concentration.

J: The reported value is an estimated concentration.

NS: Not Specified

N/A: Not Analyzed

MCL: USEPA Maximum Contaminant Level

MDE GWQS: Maryland Department of the Environment Groundwater Quality Standard

Bold result: Sample concentration exceeds the USEPA MCL

Italicized result: Sample concentration exceeds the USEPA Secondary Standard established for aesthetics (taste, color, odor)

Bold italicized result: Sample concentration exceeds the MDE GWQS

*Results for nitrate and nitrite are reported as the anion concentrations. Since the MCLs for these analytes are provided as nitrogen content of the anionic form, the laboratory results were compared to the anion equivalent concentrations of 44 mg/l and 3.3 mg/l for nitrate and nitrite, respectively, for screening purposes.

(1) MCLs/standards presented in this table are for unfiltered metals. The results for filtered metals in this table were compared with the MCLs/standards for unfiltered metals.
